## What is the Ohio Supercomputer Center?

# About OSC

- Founded in 1987
- Statewide resource for all universities in Ohio
  - high performance computing services
  - computational science expertise
  - “ ... propel Ohio's research universities and private industry to the forefront of computational based research.”
- Funded through the Ohio Department of Higher Education
- Reports to the Chancellor
- Located on OSU's west campus
- Fiscal agent is OSU

# The OH-TECH Consortium

**Ohio Supercomputer Center** provides high performance computing, software, storage and support services for Ohio's scientists, faculty, students, businesses and their research partners.

**OARnet** connects Ohio's universities, colleges, K-12, health care and state and local governments to its high-speed fiber optic network backbone. OARnet services include co-location, support desk, federated identity and virtualization.

**OhioLINK** serves nearly 600,000 higher education students and faculty by providing a statewide system for sharing 50 million books and library materials, while aggregating costs among its 90 member institutions.

**eStudent Services** provides students increased access to higher education through e-learning and technology-enhanced educational opportunities, including virtual tutoring.

**Research & Innovation Center** will operate, when opened, as the proving grounds for next-generation technology infrastructure innovations and a catalyst for cutting-edge research and collaboration.

# Active Projects Total: 469

## HPC Example Projects & Concepts

# Why would HPC be necessary for your work?

- Your simulations or analyses take too long on your personal computer
- The size of your data is too large to be contained (storage) or accessed (memory) on your computer
- You would like to free up your own system to do other tasks
- You need particular software for your work

# Mapping

Researchers who normally use OSC systems to enhance satellite images of glaciers turned their technology to disaster relief assistance following Nepal's April 2015 earthquake

# Flavor Physics

A researcher accesses OSC services to answer basic questions about the universe by modeling very high-mass particles, called quarks, which have six variations known as flavors

PI: Michael Sokoloff, Univ. of Cincinnati

# Treating Nerve Agent Exposure

With the power of OSC computing services, a team studies how to capture and destroy organophosphorus nerve agents using modified proteins.

tricity, you can use it to charge batteries."

In Spain, the Barcelona Supercomputing Center is home to a 94-torpedo machine called MareNostrum ("our sea"). The fastest in Europe (and the ninth-fastest in the world), MareNostrum has provided support to more than 200 research projects; it has simultaneously formed the uni-

the formation of the union aided in the design of now studied the impact of oil change in Europe, and even the hull design of the ship that competed in the 7 America's Cup race. Installed chapel. MareNostrum can currently handle only a third of the requests it receives.

Access is one issue the HPC community is addressing. Cray Inc., the Seattle-based supercomputer giant that built Jaguar, is working to solve another problem: flexibility. Today's machines typically use one of four processor architectures; in technical terms, they're known as scalar, vector, multithreading, and attached co-

processors. A given problem may be better on one architecture than on another. Even within a single architecture, different tasks

In the Study of U.S. Industrial HPC Users commissioned by the Council on Competitiveness, IDC asked 33 aerospace, automotive, petroleum, electronics, pharmaceutical, life sciences, and defense companies in the U.S. where they'd be if they didn't have access to high-performance computing. Their replies:

"A great example is climate modeling," says Peter Ungaro, president and CEO of Cray. "Atmospheric modeling works well on a scalar computer, while ocean modeling works well on a vector machine. Users are looking for a single computer that can efficiently run a complex variety of applications."

<b>302 GFLOPS</b>	Speed	<b>2 GFLOPS</b>

Supercomputer - 1989

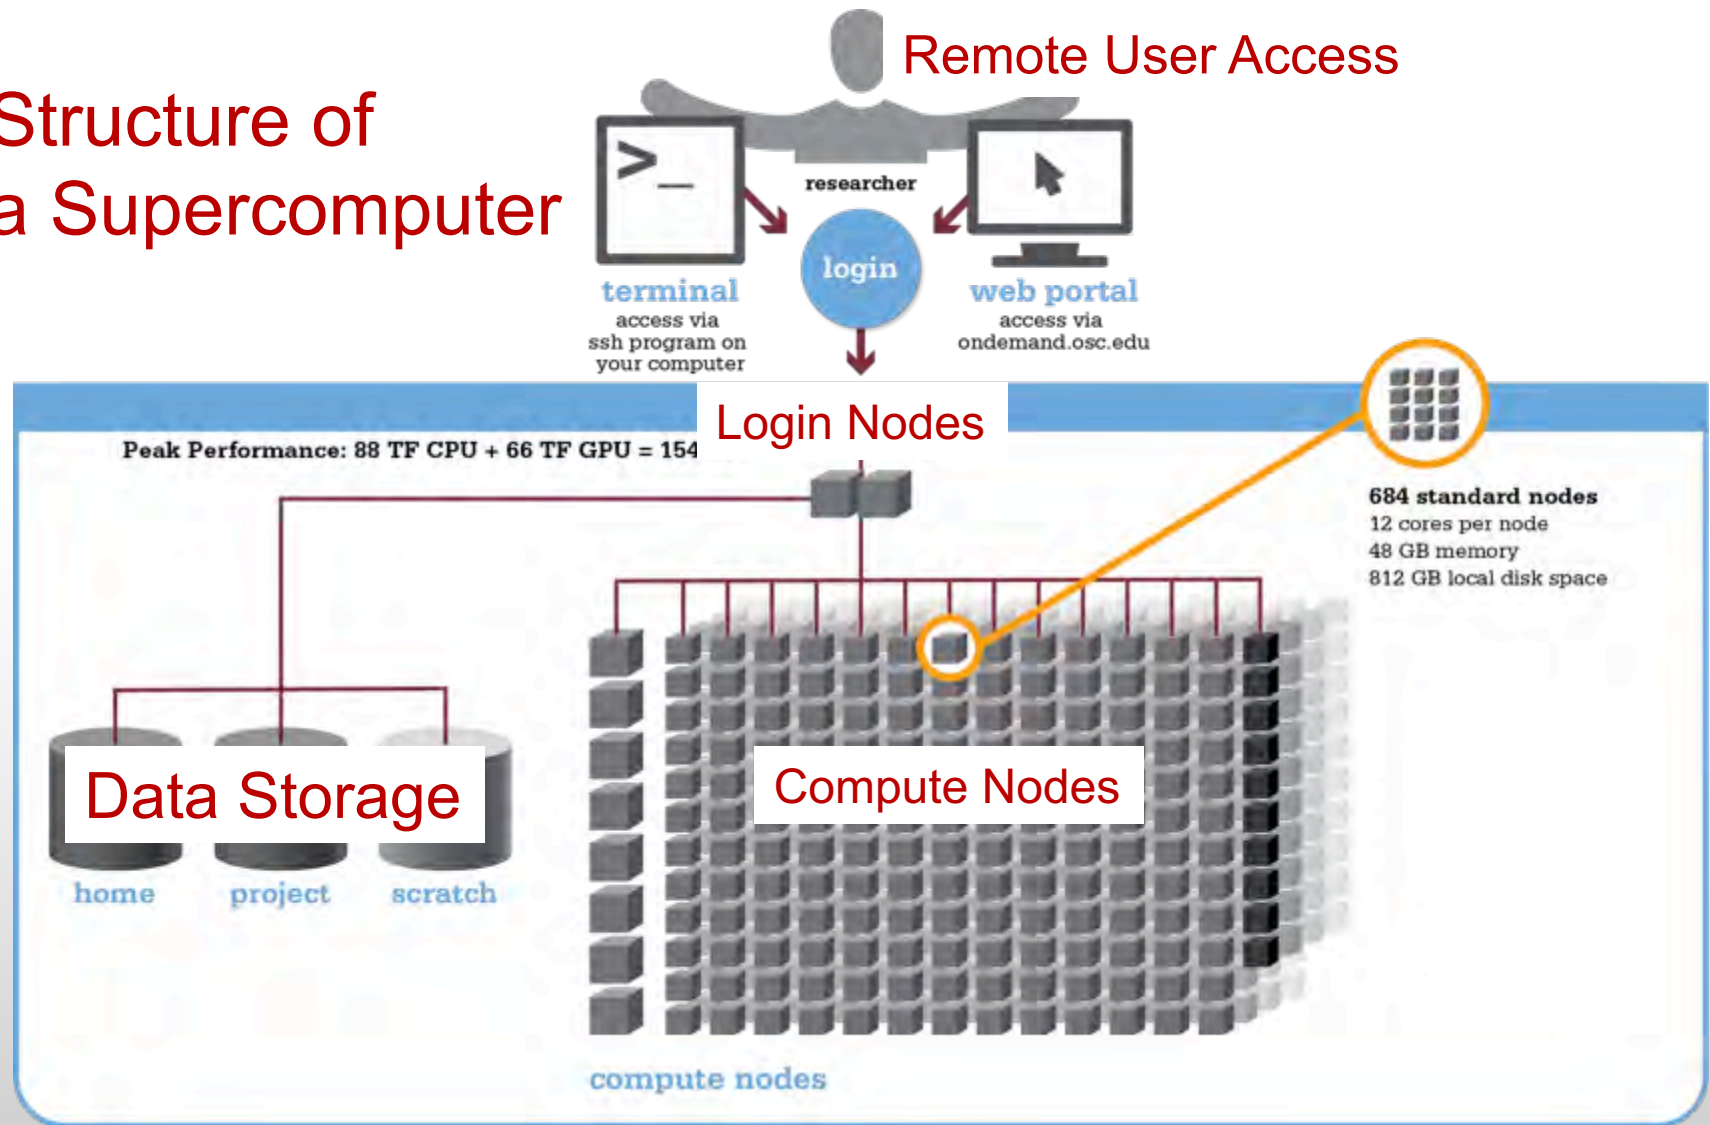

# HPC Terminology

- Cluster
  - A group of computers (nodes) connected by a high-speed network, forming a supercomputer
- Node
  - Equivalent to a high-end workstation, part of a cluster
- Core
  - A processor (CPU), multiple cores per processor chip
- FLOPS
  - “FLoating-point Operations (calculations) Per Second”

# Structure of a Supercomputer

# Big Numbers

## Prefix byte = 1 grain of rice

- K (cup of rice)
  - kilo,  $10^3$ , thousand
- M (8 bags of rice)
  - mega,  $10^6$ , million
- G (3 trucks full)
  - giga,  $10^9$ , billion
- T (2 container ships)
  - tera,  $10^{12}$ , trillion
- P (covers Manhattan island)
  - peta,  $10^{15}$ , quadrillion
- E (covers the UK 3x)
  - exa,  $10^{18}$ , quintillion

## Relation to HPC

- 1KB – very small
- 12MB L2 cache per core
- 48GB memory per node
- .5 TB disk space per user
- 4 PB aggregate storage
- Exascale systems – current research area

# Ohio Supercomputer Center

An **OH·TECH** Consortium Member

## Hardware Overview

# System Configurations

	Owens (2016)	Ruby (2014)	Oakley (2012)
Theoretical Performance	~750 TF	~144 TF	~154 TF
# Nodes	~820	240	692
# CPU Cores	~23,500	4800	8304
Total Memory	~120 TB	~15.3 TB	~33.4 TB
Memory per Core	>5 GB	3.2 GB	4 GB
Interconnect	EDR IB	FDR/EN IB	QDR IB

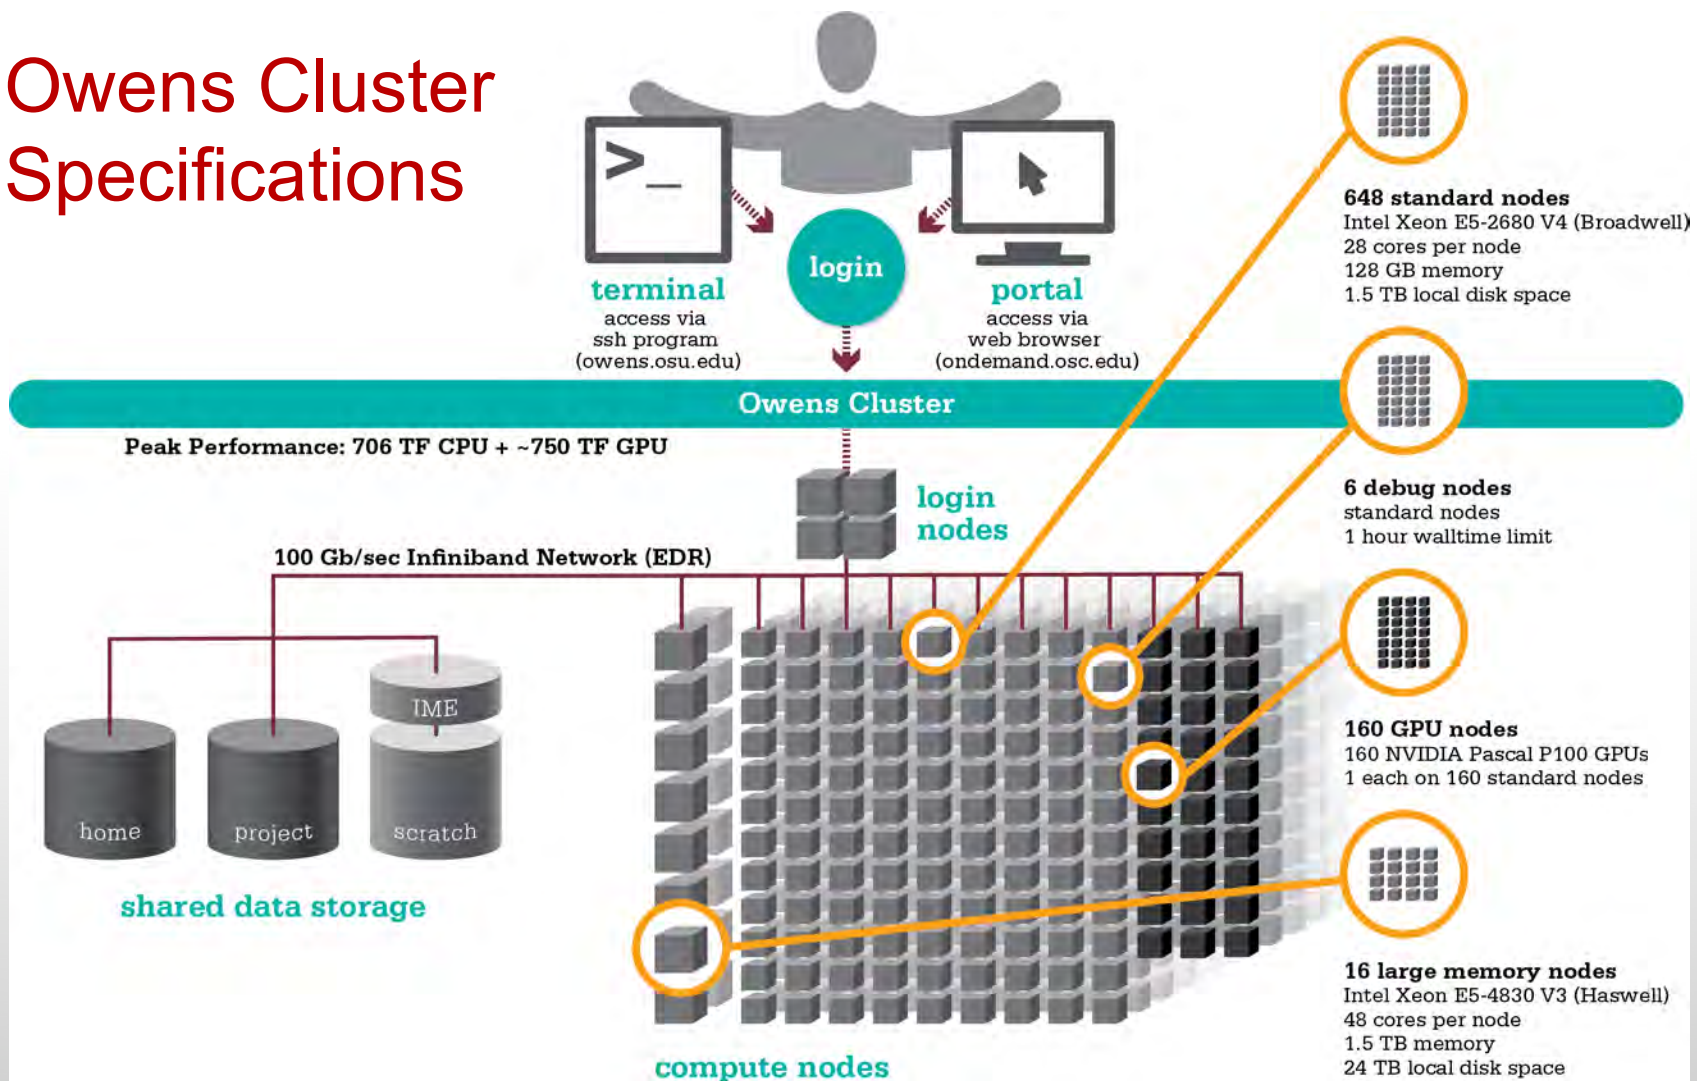

# Owens – Our Newest Cluster 5x Performance Increase

# Owens Cluster Specifications

# Login Nodes – Usage

- Purpose
  - Submit jobs to batch system
  - Edit files
  - Manage your files
  - Interactive work – small scale
- Limits
  - 20 minutes CPU time
  - 1GB memory
- Use the batch system for serious computing!

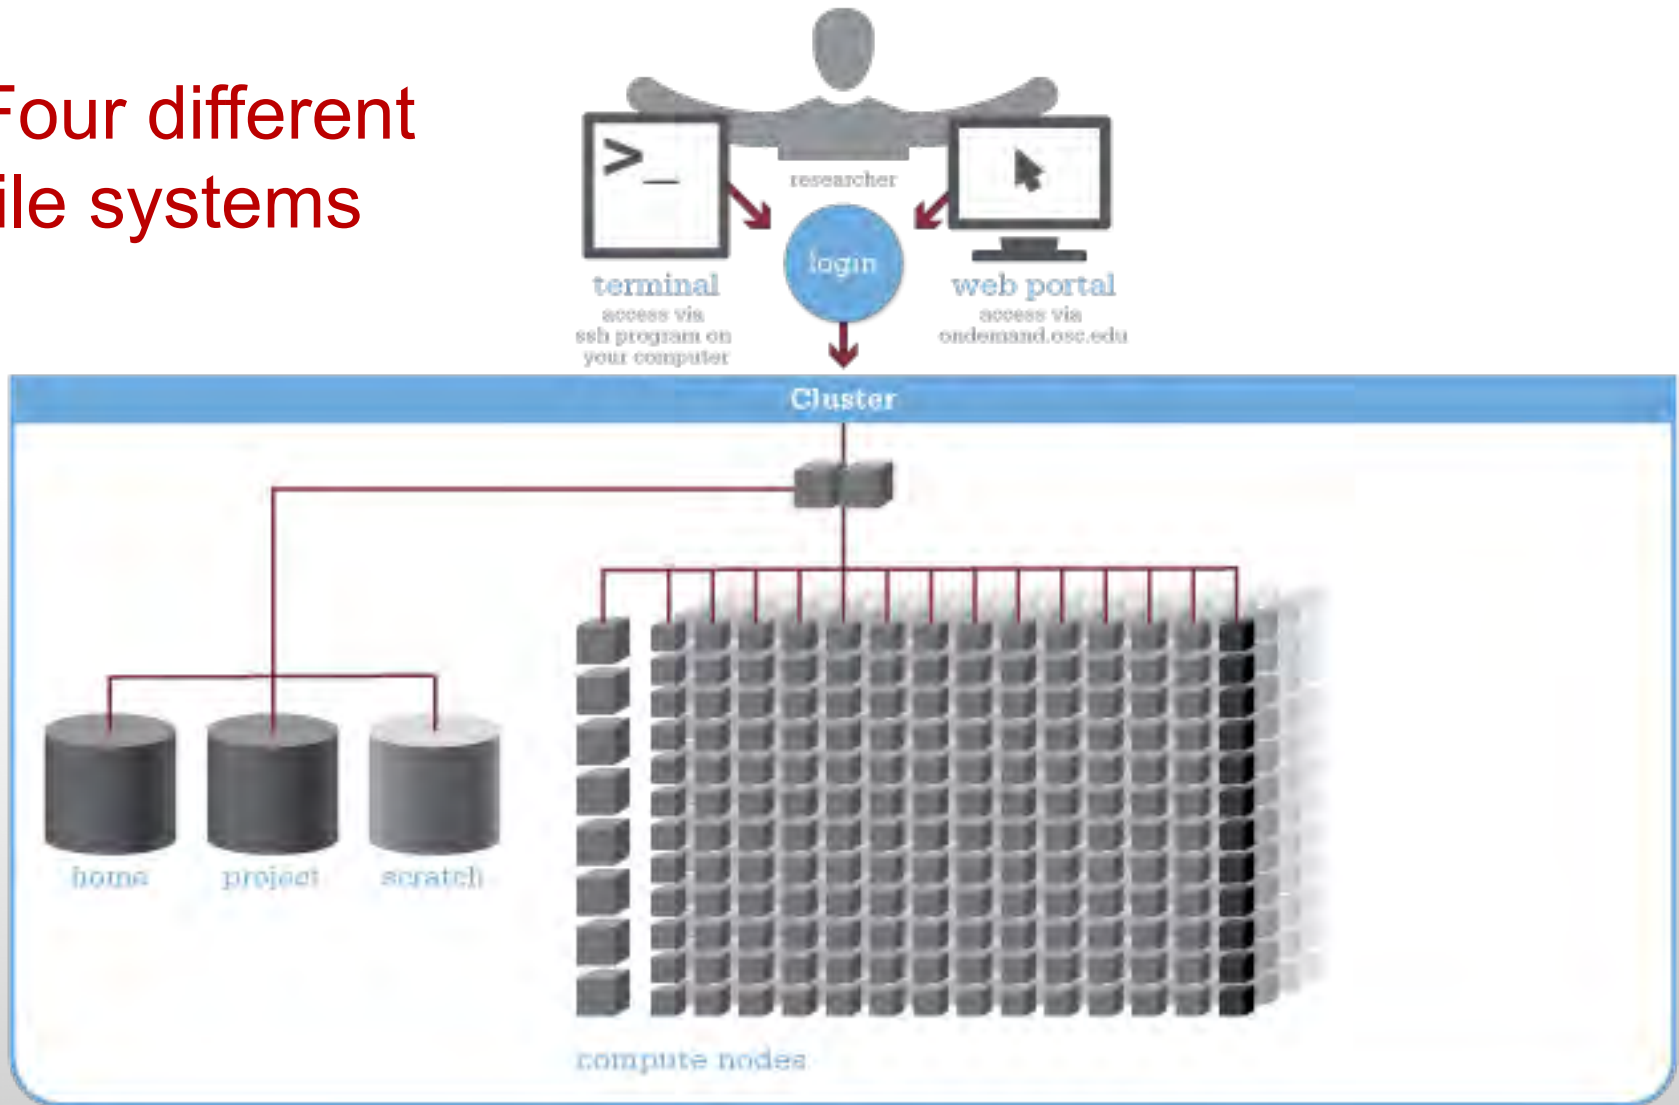

# Ohio Supercomputer Center

An **OH·TECH** Consortium Member

## Data Storage Systems

# Four different file systems

# Filesystem Overview

- Home
  - Store your files here, backed up daily
  - Use \$HOME or *~username* to reference location
- Project
  - Available to Project PIs by request; shared by all users on a project, backed up daily
  - Use */fs/project/project#* to reference location
- Scratch
  - Store large input or output files here
  - Faster I/O than Home or Project
  - Temporary storage, not backed up
- \$TMPDIR
  - Storage on compute nodes, for use during your batch job
  - Be sure to copy any results back to Home at the end of your job, all data purged when job quits

Filesystem	Quota	Backed-Up?	Purged?
Home (\$HOME)	500GB	Yes	No
Project (/fs/project)	By request	Yes	No
Scratch (/fs/scratch)	None	No	Yes – 120 days
Compute (\$TMPDIR)	800GB (Oakley), 1 TB (Ruby & Owens)	No	Yes – when job completes

# File Management

- If you are concerned about Home directory quotas:
  - Compress large, rarely used files
    - Use `gzip` or `bzip2` commands
  - Combine large numbers of small files into an archive
    - Use `tar` command
  - Request Project space for your group (PIs only)
    - Large requests are reviewed by allocations committee
    - Contact OSC Help to initiate request

# Sample Quota Display

Quota display at login (information collected nightly):

```
As of 2010 Jul 15 04:02 userid usr1234 on /nfs/06 used 28GB of
quota 500GB and 41374 files of quota 1000000 files
As of 2010 Jul 16 04:02 project/group PRJ0321 on /nfs/proj01
used 27GB of quota 5000GB and 573105 files of quota 1000000
files
```

Output from `quota` command (run manually):

```
Disk quotas for user usr1234 (uid 11059):
Filesystem
      blocks    quota    limit    grace    files    quota    limit    grace
fs06-oak.ten.osc.edu:/nfs/06/osc
      201698292  4500000000  524288000          631137  950000  1000000
```

# Ohio Supercomputer Center

An **OH·TECH** Consortium Member

## User Environment

# User Environment Topics

- Connecting to the clusters
- Transferring Files

# Linux Operating System

- “UNIX-like”
- Widely used in HPC
- Mostly command-line
- Choice of shells (bash is default)
- Freely distributable, open-source software
- Tutorials available
- [www.linux.org](http://www.linux.org)

# Connecting to the clusters

- Connect to OSC machines using **ssh** (secure shell)
  - From a Linux/UNIX machine : At prompt, enter  
`ssh userid@oakley.osc.edu`  
`ssh userid@ruby.osc.edu`
  - From a Mac: Enter **ssh** command in TERMINAL window
  - From Windows: **ssh** client software needed
    - Both commercial and free versions are available
- New: Connect using OnDemand portal (web-based)

# Connecting to an OSC Cluster with Graphics

- Programs on the cluster can have an X-based GUI
  - Display graphics on your computer
- Linux/UNIX and Mac: Use **-x** flag

```
ssh -X userid@oakley.osc.edu
```
- Windows: Need extra software
  - Both commercial and free versions are available
  - Configure your ssh client to tunnel or forward X11
- Primarily used with programs on login node
  - Can also use with interactive batch jobs

# OSC OnDemand [ondemand.osc.edu](http://ondemand.osc.edu)

- 1: User Interface
    - Web based
      - Usable from computers, tablets, smartphones
      - Zero installation
    - Single point of entry
      - User needs three things
        - [ondemand.osc.edu](http://ondemand.osc.edu)
        - OSC Username
        - OSC Password
      - Connected to all resources at OSC
  - 2: Interactive Services
    - File Access
    - Job Management
    - Visualization Apps
      - Desktop access
      - Single-click apps (Abaqus, Ansys, Comsol, Paraview)
    - Terminal Access
- Tutorial available at**  
[osc.edu/ondemand](http://osc.edu/ondemand)

## Message of the Day

### 2016/05/24 - SYSTEM DOWNTIME: JUNE 7TH

A downtime is scheduled for all HPC systems starting June 7th. The downtime will affect all clusters and services. Login shells will not be available during this time.

In preparation for the downtime the batch scheduler will be restarted on June 7th. Jobs that are held will be scheduled after the system

Virtual Desktop Interface

🖥 Oakley VDI

🌈 Paraview

Compute Node Session

🖥 Oakley Desktop

🟢 Abaqus/CAE

📐 ANSYS Workbench

🇫 COMSOL

is scheduled to finish by 5PM.

Other systems will not be

affected. All jobs must be complete before 6AM June 7th.

# Transferring Files to and from the Cluster

- Most file transfers to and from OSC machines use **sftp** or **scp**
  - Linux and Mac have them built in
  - Windows needs extra software - FileZilla
- For small files, connect to login node  
**oakley.osc.edu**
- For large files, transfer may fail due to shell limits
  - Connect to **gridftp01.osc.edu** (file transfer only)

# File Permissions

- By default all files are readable by all users
- Check permissions using `ls -l`

```
-rw-r--r--  1 osu7824 PAS0925   10839 Jan 13  2015 triarm_VVVacid.sdf
-rw-r--r--  1 osu7824 PAS0925   11667 Jan 13  2015 triarm_VVVester.sdf
drwxr-xr-x  8 osu7824 PAS0925    4096 Jan 16  2014 tutorial

## Batch Processing

# Why do supercomputers use queueing?

# Batch System at OSC

- Compute nodes are allocated through the batch system
  - PBS – Portable Batch System
  - Torque – resource manager
  - Moab – scheduler
- Documentation at  
[www.osc.edu/supercomputing/batch-processing-at-osc](http://www.osc.edu/supercomputing/batch-processing-at-osc)

# Idea Behind Batch Processing

- Whatever you would normally type at the command prompt goes into your batch script
- Output that would normally go to the screen goes into a log file (or files)
- The system runs your job when resources become available
- Very efficient in terms of resource utilization

# Steps for Running a Job on the Compute Nodes

1. Create a batch script for a job
2. Submit the job
3. Job gets queued
4. Job runs when resources become available
5. Get your results when the job finishes

# Specifying Resources in a Job Script

- Nodes and cores (processors) per node
- Memory
- GPUs
  - See “Batch Processing at OSC” on OSC website
- Walltime
  - Overestimate slightly – job will be deleted if it hits limit
  - Shorter job may start sooner due to backfill
- Software licenses
  - See specific software page on OSC website

# Sample Batch Script

```
#PBS -N serial_fluent
#PBS -l walltime=1:00:00
#PBS -l nodes=1:ppn=28
#PBS -j oe
#PBS -l software=fluent+1
# Set up the FLUENT environment
module load fluent
# Move to directory job was submitted from
cd $PBS_O_WORKDIR
# Copy input files to compute node
cp run.input $TMPDIR
cd $TMPDIR
# Run fluent and copy results back to home
fluent 3d -g < run.input
cp `results*` $PBS_O_WORKDIR
```

Job setup information  
for PBS

# This is a comment

Commands  
to be run

Put all this into a text file!

# Submitting a Job and Checking Status

- Command to submit a job
  - `qsub script_file`
- Response from PBS (example)
  - `123456.oak-batch.osc.edu`
- Show status of batch jobs
  - `qstat -a jobid`
  - `qstat -u username`
  - `qstat -f jobid`

[List of Batch commands](#) on osc.edu

# Scheduling Policies and Limits

- Walltime limit
  - 168 hours for serial jobs (single node)
  - 96 hours for parallel jobs (multiple nodes)
- Per-user limits
  - 128 concurrently running jobs
  - 2040 processor cores in use
  - 1000 jobs in the batch system, running or queued
- Per-group limits
  - 192 concurrently running jobs
  - 2040 processor cores in use

# Waiting for Your Job To Run

- Queue wait time depends on many factors
  - System load
  - Resources requested
    - nodes, cores, large memory, gpus, software licenses
  - Fair share limits (if load is high)
    - reduced priority for users or groups using a lot of resources

# Job Output

- Screen output ends up in file *job\_name.ojobid*
  - Copied to your working directory when job ends
  - Example: `testjob.o1234567`
- To see screen output while job is running
  - `qpeek jobid`
  - Example: `qpeek 1234567`

# Interactive Batch Jobs

- Interactive, but handled through batch system
  - Resource limits same as standard batch limits
- Useful for tasks forbidden on login nodes
  - Debug parallel programs
  - Run a GUI program that's too large for login node
- May not be practical when system load is high
  - Long wait, same as standard batch job
- To submit an interactive batch job (example)
  - `qsub -I -X -l nodes=2:ppn=28 -l walltime=1:00:00 -m abe`

# Batch Queues

- The three clusters have separate batch systems
  - Submit job and check status on the same cluster
- Debug reservation
  - A few nodes on each system are reserved for short jobs ( $\leq 1$  hour)
  - Special flag required on Ruby and Owens: `-q debug`

# Parallel Computing

- Each processor is fast, but real speed comes from using multiple processors
- Multithreading
  - Use multiple cores on a single node
  - Shared memory
- Message passing (MPI)
  - Use one or multiple nodes
  - Distributed memory

# Ohio Supercomputer Center

An **OH·TECH** Consortium Member

## Loading and Running Software

# Modules for Software access

- How modules work
  - Modify environment variables like `$PATH` and `$MANPATH` within your shell
- Default set of modules loaded at login
  - module system, batch system (do not unload)
  - default compiler and MPI modules
- Do NOT completely replace `$PATH` in your `.bash_profile` or `.bashrc`
- DO prepend directories to the existing `$PATH`
  - Type: `export PATH=$HOME/bin:$PATH`

# Module Commands

- What modules do you have loaded?
  - `module list`
- What modules are available?
  - `module spider` or `module avail`
- Multiple versions of the same software
  - `module avail intel`
- Add a software module to your environment
  - `module load cuda`
- Remove a software package from your environment
  - `module unload intel`
- Load a different software version
  - `module swap intel intel/13.1.3.192`

## Adding or Removing Software from Your Environment

- Load the module for the software you need, e.g.,
  - `module load comsol`
- Allows multiple versions of software to coexist on our system
- Allow us to make changes without affecting you
  - PLEASE DON'T HARDCODE PATHS!
- Can load modules at command prompt or in your `.bash_profile` or `.bashrc` file
- Also load modules in your job (batch) scripts

# Third party applications

- **General programming software** (¢ statewide licensed)
  - gnu compilers and debugger
  - ¢ Intel compilers
  - ¢ Totalview debugger
  - ¢ Allinea profiler
  - MPI library
  - HDF5
  - NetCDF
  - Java, Java Virtual Machine
  - Python

# Third party applications

- **Parallel programming software** (statewide licensed)
  - MPI library (mvapich, mvapich2)
  - OpenMP
  - CUDA
  - OpenCL
  - OpenACC

# Access to Licensed Software

- Most software licenses for academic use only
- Some software requires signed license agreement
  - Check website
  - Contact OSC Help
- List of applications can be found at Software page:  
<http://www.osc.edu/supercomputing/software/>

# OSC doesn't have the software you need?

- Commercial software
  - Fill out a request form (see our FAQ)
  - SUG will consider it
- Open-source software
  - You can install it yourself in your home directory
  - If there's enough demand, we can install it for shared use
- Have your own license?
  - Contact OSC Help
